Provided dye-sensitized solar cell including is a liquid-type imidazolium material, which is liquid at a room temperature to a high temperature, as electrolyte. The dyesensitized solar cell includes a semiconductor electrode; a electrode; confronting and electrolyte of vinylalkylimidazolium iodide family being inserted between the semiconductor electrode and the confronting electrode. the solar cell of the present research uses vinylalkylimidazolium iodide instead iodine-family of oxidation and reduction electrolyte including organic solvent easily volatilized at a high temperature. Thus, the solar cell can have excellent thermal stability and temperature stability as well as high energy conversion efficiency.
